**DETAILED ACTION**

***Allowable Subject Matter***

Claims 1-26 are allowable. The following is a statement of reasons for the indication of allowable subject matter: With respect to claims 1, 8, 12, 16, 23, and 26, a disk drive control circuit wherein, during normal operation, control logic controls a plurality of switching elements to provide electrical power to a spindle motor and head motor of the disk drive from a voltage source coupled to first and second voltage supply nodes, the spindle motor having a set of motor windings to which the electric power is applied to rotate the spindle motor, the improvement wherein: the control logic is configured to enter a regenerative braking state during normal operation where the switching elements are controlled to isolate the spindle motor from the first voltage supply node and cause regenerative braking of the spindle motor so that kinetic energy due to rotation of the spindle motor is converted to electrical power that is supplied to the head motor by virtue of inductance of one or more motor windings in the set, and the control logic enters the regenerative braking state with the spindle motor isolated from the first voltage supply node for at least a portion of at least one seek operation to be performed by the disk drive.
